Project Management

João Passos 1210646
Pedro Vicente 1180558

This project was managed through the division of tasks between the two elements of the group. The final project can be divided in the following systems:

- Python Interface
- Infrared sensors
- Motors
- Assembly
- Main program

Of the five mentioned systems, the Main program was the only one being updated by both elements of the group so, this program was managed through Git.
All files related to this project were introduced in the repository in order to mitigate different versions of files.
The project organization was mainly achieved through daily meetings where we would talk about developments, problems and possible solutions of all the systems since the last reunion. Despite not being the intended way to manage the project evolution, it turned out to be very effective.

The repository used can be found in the following link: GitHub
